Java Persistence API Exercises

Introduction

We have changed the hibernate standard to JPA and created some books and an author.
In this exercise we want to use persist cascading and remove cascading.

Tasks

- Use persist cascade so when you persist the author, the books that this author has written will be persisted automatically. (This should be done in Author class)
- Write some tests (by creating a new author and 3 books, and then persist only the author) and see if the books persist too.
- Write a method in the Author class that creates a book and adds it to the collection. Create an author and several books in the main method using this method. Test the tables and see if it works.
- Remove the author without removing the books manually. (You should use remove cascade). Check your database and see if the books are deleted too.
